

- High efficiency chelation leads to faster nutrient uptake
- Boosts photosynthesis
- A cofactor for enzymes involved in chlorophyll production
- Induces increased pest and disease resistance

Nutricycler Copper is a potent mix of micronutrient copper with high efficiency Nutricycler chelation technology for enhanced nutrient uptake.

The key function of the product is for enhanced foliar uptake of the micronutrient copper and rapid correction of micronutrient deficiency in plants and soils.

Unique chemistry ensures superior uptake and translocation of copper across a wide range of crops. By improving nutrient mobility within the plant, it enhances growth, productivity, and crop quality. The formulation supports better nutrient availability in the root zone and within plant tissues, helping crops perform optimally under varied growing conditions. Use it to elevate nutrient use efficiency and crop outcomes.

#### Key Functions of Copper:

- Enzyme activation and redox balance
- Photosynthesis and energy production
- Cell wall strength and stem structure
- Reproductive development and pollen viability
- Plant immunity and disease resistance

<b>Key Inputs</b>	6.38% Cu wt/vol Nutricycler Polysaccharide Chelator Amino acids and Fulvic acids
<b>Shelf Life</b>	24 months when stored in a standard agri-input warehouse at farm or retail stores.
<b>Timing</b>	Use integrated with existing crop nutrient mgmt. practices.
<b>Application Rate</b>	Spray 1.0 litre / ha with water rate 100 litres / ha Apply by boom spray directly to the plant leaf surface or to soil as required.
<b>Applications</b>	Broadacre, horticulture, pasture, lawn, nursery, landscaping

**MANUFACTURED IN AUSTRALIA**
