

- High efficiency chelation leads to faster nutrient uptake

Converte Nutricycler Zinc is a potent mix of micronutrient Zinc with high efficiency Nutricycler chelation technology for enhanced nutrient uptake.

The key function of the product is for enhanced foliar uptake of the micronutrient zinc and rapid correction of micronutrient deficiency in plants and soils.

Unique chemistry ensures superior uptake and translocation of zinc across a wide range of crops. By improving nutrient mobility within the plant, it enhances growth, productivity, and crop quality. The formulation supports better nutrient availability in the root zone and within plant tissues, helping crops perform optimally under varied growing conditions. Use it to elevate nutrient use efficiency and crop outcomes.

Key Functions of Zinc:

- Enhances plant growth and development.
- Improves crop yield and quality.
- Boosts resistance to environmental stress.
- Supports enzyme and protein formation.
- Ensures efficient nutrient absorption, uptake

Key Inputs	8.39% Zn wt/vol Nutricycler Polysaccharide Chelator Amino acids Fulvic acids
Shelf Life	24 months when stored in a standard agri-input warehouse at farm or retail stores.
Timing	Use integrated with existing crop nutrient management practices.
Application Rate	Spray 1.0 litre / ha with water rate 100 litres / ha Apply by boom spray directly to the plant leaf surface or to soil as required.
Applications	Broadacre, horticulture, pasture, lawn, nursery, landscaping

MANUFACTURED IN AUSTRALIA
